### Abstract

Varied marine and estuarine ecosystems of Tamil Nadu endowed with diverse fish fauna. A total of 1656 fish species under two classes, 40 orders, 191 families and 683 genera reported from marine and estuarine waters of Tamil Nadu. In the checklist, 1075 fish species were primary marine water and remaining 581 species were diadromus. In total, 128 species were reported under class Elasmobranchii (11 orders, 36 families and 70 genera) and 1528 species under class Actinopterygii (29 orders, 155 families and 613 genera). The top five order with diverse species composition were Perciformes (932 species; 56.29% of the total fauna), Tetraodontiformes (99 species), Pleuronectiformes (77 species), Clupeiformes (72 species) and Scorpaeniformes (69 species). At the family level, the Gobiidae has the greatest number of species (86 species), followed by the Carangidae (65 species), Labridae (64 species) and Serranidae (63 species). Fishery status assessment revealed existence of 1029 species worth for capture fishery, 425 species worth for aquarium fishery, 84 species worth for culture fishery, 242 species worth for sport fishery and 60 species worth for bait fishery. Threat status assessment as per IUCN Red List comprises of 3.75% threatened fish species, 50.25% non threatened fish species and 46.01% of fish species have not yet been assessed for their conservation status by IUCN. An updated checklist with note on habitat, fishery and conservation status might support the rational development, management and conservation of fishery resources in coastal areas of Tamil Nadu.

### 1 Introduction

Tamil Nadu is the southern most state in India, flanked by Andhra Pradesh, Karnataka on the North / North West; Indian Ocean on the south; Kerala on the west and Bay of Bengal on the east. The coastline of Tamil Nadu has a length of about 1076 kms (Ramesh et al., 2008; Barman et al., 2011), constitutes about a 15% of

the total coastal length of India and stretches along Bay of Bengal, Arabian Sea and Indian Ocean. The state has 1076 kms of coastal length and 0.19 lakh sq km of exclusive economic zone (EEZ) up to 200 nautical miles from the shore (Ramesh et al., 2008; Barman et al., 2011). The total estuarine area of Tamil Nadu was estimated to be 56000 ha, which accounts 3.88 % of the total estuarine area of India (De, 2011). The estuaries and brackish water wetlands in Tamil Nadu were Adyar, Agniar, Alankulam, Ambuliyar, Araniar, Arasalar, Athankarai, Coleroon, Cooum, Edaiyur-Sadras, Ennore, Gadilum, Giriyampeta, Gulf of Mannar lagoon, Gundar, Kaliveli lagoon, Kallar, Kanjirankudi, Karumeniyar (Manapadu), Kaveri, Kollidam, Kottakarayar, Kuduviyar, Manakudy, Manimuttar, Muthupet lagoon, Muttukadu backwaters, Muttukadu lagoon, Nambiyar, Nandalar, Palayakayal, Pambar, Pantri, Pazhayar, Pichavaram, Ponnaiyar, Pulicat lake (South) lagoon, Pullavazhi, Punnakayal, Sayalkudi, Thengapattinam, Thirumullaivasal, Uppanar, Uppar, Vaigai, Vaipar, Valliyar, Velankanni, Vellar, Vembar, Vennar, Vettar and Yedayanthittu (Ramesh et al., 2008; Mogalekar et al., 2017).

Tamil Nadu has a very rich marine and estuarine fish fauna and its ichthyofauna is characterized by unique elements of Indian Ocean origin (Barman et al., 2011; Gopi and Mishra, 2015). Since the 1849, ichthyologists have investigated fish fauna in coastal and estuarine areas of Tamil Nadu and a large amount of information has been published on taxonomic, biological and biogeographical aspects. Jerdon (1849) was the first to describe fishes of Tamil Nadu. In the present article, we collected and synthesized these scattered data from relevant literature including Jeyaseelen and Krishnamurthy (1980), Ramaiyan et al. (1987), Venkataraman et al. (2002), Mishra and Krishnan (2003), Remadevi et al. (2004), Ramanujam (2005), Ramanujam and Anbarasan (2008), Ramesh et al. (2008), Barman et al. (2011), Varghese et al. (2011), Jawahar et al. (2013), Kannappan and Karthikeyan (2013), Ramanujam et al. (2014), Theivasigamani and Subbiah (2014), Murugan et al. (2014), Bharadhirajan et al. (2015), Khan (2015), Mahesh and Saravanakumar (2015), Pavinkumar et al. (2015), Raju et al. (2015), Govindan and Ravichandran (2016), Joshi et al. (2016), Karuppasamy (2016), Mogalekar et al. (2017), Varghese et al. (2017). The updated, complete, scientific database of fish diversity still lacks in marine and estuarine ecosystems of Tamil Nadu. The present study aims to provide an authentic checklist of fishes so far known from marine and estuarine waters of Tamil Nadu for increasing awareness of fish taxonomy, together with conservation, management and sustainable utilization of fishery resources.

## 2 Methodology

The updated checklist of marine and estuarine fish fauna from different localities of of Tamil Nadu was prepared by extensive surveys in selected fish landing centers, and reviewing and analyzing the old publications as described in Table 1. The reported localities of marine and estuarine areas in Tamil Nadu are indicated in Figure 1. The literature on marine and estuarine fish fauna of Tamil Nadu was collected by online browsing using key words like marine fish fauna of Tamil Nadu, estuarine fish fauna of Tamil Nadu, marine fish diversity of Tamil Nadu, estuarine fish diversity of Tamil Nadu, fish diversity of estuaries from Tamil Nadu, fish diversity of coastal waters of Tamil Nadu. Details on locality, habitat and fishery information of all the fish species were obtained by retrieving species level information from published literature as well as Fishbase (Froese and Pauly, 2013). Classification of all taxa follows Talwar and Kacker (1984) and fishbase (Froese and Pauly, 2013) and the valid nomenclature of species was adopted as per the Catalogue of Fishes of the California Academy of Sciences (Eschmeyer et al., 2018). Orders of fish species in checklist were treated in an alphabetical sequence and within families, genera and species are treated in an alphabetical sequence. Information on the conservation status was retrieved from the International Union for Conservation of Nature and Natural Resources (IUCN) Red List Categories and criteria (IUCN, 2018). While preparing checklist, we

have not considered any species that has published in predatory journals in which the peer review is compromised (Raghavan et al., 2014).

### 3 Results

The present checklist includes 1656 species of fishes as inhabiting marine and estuarine habitats in Tamil Nadu, distributed across 2 classes, 40 orders, 191 families and 683 genera. In the checklist, 1075 fish species were primary marine water and remaining 581 species were diadromus (Table 2). A total of 128 species were reported belonging to class Elasmobranchii, which distributed as 11 different orders, 36 families and 70 genera (Table 4). The order Carcharhiniformes was dominant in class Elasmobranchii with 40 species or 31.25% of the total species recorded under the chondrichthyes. The second highest number of species was recorded under the order Myliobatiformes with 39 species (30.47% of total species under chondrichthyes) (Table 3). Under the class Actinopterygii, the total number of species recorded were 1528 distributed as 29 different orders, 155 families and 613 genera (Table 4). Dominant in the overall fish fauna was the order Perciformes with 932 species or 56.29% of the total fauna follows Tetraodontiformes with 99 species (5.98% of total). Other orders with noteworthy numbers of species were the Pleuronectiformes (77 species or 4.65% of total), Clupeiformes (72 species or 4.35% of total), Scorpaeniformes (69 species or 4.17% of total) and Anguilliformes (51 species or 3.07% of total) (Table 3). The top four families with the highest number of species were the Gobiidae (86 species), Carangidae (65 species), Labridae (64 species) and Serranidae (63 species) (Table 2).

Fishery status of marine and estuarine fish fauna of Tamil Nadu revealed existence of 1029 species worth for capture fishery, 425 species worth for aquarium fishery, 84 species worth for culture fishery, 242 species worth for sport fishery and 60 species worth for bait fishery (Table 2). Threat status assessment of the marine

and estuarine fish fauna of Tamil Nadu comprises of four species under critically endangered (CR) category facing an extremely high risk of extinction in the wild, 13 species were under endangered (EN) category facing a very high risk of extinction in the wild, 45 species were under vulnerable (VU) category facing a high risk of extinction in the wild, 46 species are under near threatened (NT) category is likely to qualify for a threatened category in the near future, 699 species are under least concern (LC) category included in widespread and abundant taxa, 87 species are under data deficient (DD) category and 762 species has not yet been evaluated against the criteria (Table 2).

#### 4 Discussion

An authentic and updated checklist of the marine and estuarine fishes of Tamil Nadu is presented, along with their classification, habitat, fisheries status and IUCN Red List conservation status (Table 2). An authentic assessment of fish diversity from marine and estuarine habitats of Tamil Nadu recognizes an estimated 1656 valid species distributed across 2 classes, 40 orders, 191 families and 683 genera. The fish fauna of India is highly diverse in nature with 3231 valid species of freshwater and marine fishes (Gopi and Mishra, 2015). The fish diversity of India constitutes 9.30% of the total number of about 34,725 species of fish known from the world (Eschmeyer et al., 2018). The marine and estuarine fish diversity of Tamil Nadu constitute about 51.25% to the total fish diversity of India (Gopi and Mishra, 2015) and 4.76% to the total fish diversity of world (Eschmeyer et al., 2018). The fish families and genera are expanding with newly described species from Tamil Nadu. The increase in species year after year indicates that there are many new yet to discover from the diverse marine and estuarian ecosystems (Gopi and Mishra, 2015). Of this total marine and estuarine fish diversity of Tamil Nadu, primary marine fishes (1075 species) constitute 44.0 percent to the total marine fish diversity of India (Gopi and Mishra, 2015). Recent information compiled by Mogalekar et al (2017) reveals

that 330 species of fishes are recognized from 13 estuaries of Tamil Nadu. The estimated 581 brackish cum marine water fish species recognized from Tamil Nadu is much higher than the total estuarine fish diversity of Tamil Nadu (Mogalekar et al., 2017).

It is observed that the checklist dominated by the orders: Perciformes (56.29%), Tetraodontiformes (5.98%), Pleuronectiformes (4.65%), Clupeiformes (4.35%), Scorpaeniformes (4.17%) and Anguilliforms (3.07%); and families: Gobiidae (5.2%), Carangidae (3.93%), Labridae (3.87%) and Serranidae (3.8%). Similar dominance of perciformes and clupeiformes were indicated by Ramaiyan et al. (1987), Venkataraman et al. (2002), Mishra and Krishnan (2003), Ramesh et al. (2008), Barman et al. (2011), Gopi and Mishra (2015), Joshi et al. (2016), Karuppasamy (2016), Mogalekar et al. (2017). As numbers of capture, ornamental, sports, cultivable and bait fishes are high, commercial and recreational fishing providing livelihood to coastal people. The broodstock development of fast growing fish from wild for captive breeding, seed production and coastal aquaculture could be additional source of income to coastal people. Only 3.75% of the marine and estuarine fishes of Tamil Nadu were listed as threatened and 50.25% of the fishes were listed under non threatened category in the IUCN Red List. However, 46.01% of fish species occurring in the marine and estuarine waters of Tamil Nadu have not yet been evaluated for their conservation status by IUCN due to lack of scientific investigations. The broodstock development, captive breeding, seed production and ranching of threatened fishes might help to overcome the problems of species endangerment.

### 5 Conclusions

Unique marine and estuarine ecosystems of Tamil Nadu blessed with diverse fish fauna useful for livelihood of coastal people. The existing data indicated the insufficient scientific studies on marine and estuarine fishes from the different locality of Tamil Nadu. Henceforth, further research need to be conducted on fish identification, taxonomic diversity, patterns of distribution and conservation status in Tamil Nadu for planning appropriate conservation strategies.
